Wellbore History

GENERAL

Well 25/4-12 S was drilled to appraise the 25/4-3 Gekko discovery in the Vana Sub-basin in the North Sea. The primary objective was to confirm continuation of reservoir and hydrocarbons in the southern part of the Gekko structure. A geological side-track 25/4-12 A was planned after 25/4-12 S to test the northern part of the structure.

OPERATIONS AND RESULTS

Appraisal well 25/4-12 S was spudded with the semi-submersible installation Deepsea Stavanger on 3 June 2018. It was drilled to 525 m in the Nordland Group where the bottom hole assembly became stuck and was lost in hole. The well was abandoned.

The well did not fulfil the objectives.

No cores were cut. No fluid sample was taken.

The well was permanently abandoned on 6 June 2018 as a junk well. Consequently, the planned 25/4-12 A was cancelled. The drilling facility was moved and replacement wells 25/4-13 S with side-track 25/4-12 A was initiated.

TESTING

No drill stem test was performed.
