

## Wellbore History

### GENERAL

Wildcat well 35/3-3 was drilled in the Norwegian sector of the North Sea approximately 50 km west of Måløy, Norway. The primary target was to test the possible extension of Lower Cretaceous sandstones to the east of those encountered in wells 35/3-1 and 35/3-2. A stratigraphic trap was thought to exist in these sandstones. A secondary target was possible sandstones of Early Jurassic age with a possible pinch-out trap.

### OPERATIONS AND RESULTS

Well 35/3-3 was spudded with the semi-submersible installation Byford Dolphin on 30 October 1980. It was drilled and logged to 900 m, then junked because of technical problems running the 20" casing. The rig was moved about 20 meters, and the well was respudded on 30 November 30 1980 as 35/3-4.

### TESTING

No drill stem test was performed
