

Wellbore History

TD of the well was proposed to be 5000 m below sea level or in Palaeozoic formations whatever came first.

Well 31/2-4 was spudded with the semi-submersible installation Borgny Dolphin on 1 September 1980 and drilled to TD at 815 m in the Hordaland Group. The well was drilled with seawater and hi-vis pills. After having set the 20" casing, the well was secured and suspended on September 13 due to a farm out of the rig to Statoil. Statoil had requested the Borgny Dolphin to be released to secure their well 34/10-10, which was blowing gas from a shallow gas zone.

The well was classified as a dry well.

No drill stem test was performed in the well.
